

***LinMot[®]* Linear-Rotary Motors**

Version 2.96e

CAUTION

LINMOT SLIDERS CONTAIN NEODYMIUM MAGNETS WHICH MAY DISTURB OR DAMAGE MAGNETIC DATA CARRIERS AND DELICATE ELECTRONIC EQUIPMENT MERELY BY COMING CLOSE TO THEM.

WHEN HANDLING SLIDERS BE AWARE THAT, DUE THE STRONG MAGNETIC ATTRACTION, INJURY FROM FINGERS BEING PINCHED BETWEEN THE SLIDER AND NEARBY STEEL PARTS IS A VERY REAL POSSIBILITY IF CAUTION IS NOT EXERCISED.

THE SLIDERS OF LINMOT® MOTORS CAN REACH TEMPERATURES WHICH MAY CAUSE BURNS UPON BEING TOUCHED.

THE SLIDERS AND SHAFTS OF LINMOT® LINEAR-ROTARY MOTORS ARE FAST-MOVING MACHINE PARTS. THE USER MUST TAKE ALL NECESSARY PRECAUTIONS TO PREVENT THEIR BEING TOUCHED (PROVIDE COVERS, PROTECTION AGAINST TOUCHING ETC.).

DO NOT RUN INTO THE INTERNAL MECHANICAL END STOPS.

Linear-Rotary Motors series PR01-52 and PR01-84

Overview

LinMot PR01 Linear-Rotary Motors

The LinMot PR01 series of Linear-Rotary motors includes various sizes that differ primarily in the maximum torque available from the rotary motor or the linear force available from the linear motor. In addition to the different sizes, variants with axial through-holes (for a pneumatic line or an ejector, for example) and stainless steel models are available.

A Linear-Rotary motor fundamentally consists of a linear motor with an attached rotary torque motor. The two motors are electrically independent units and can be controlled completely independently of each other.

1. Rotary Motor
2. Linear Motor
3. Shaft (moves linear and rotating)
4. Slider of the Linear Motor (moves linear)
5. Option: Heat sinks for Linear Motor
6. Option: Clamp Set for load attachment
7. Option: Fan kit for Rotary Motor
8. Option: Wiper
9. Option: MagSpring kit UNO
10. Option: MagSpring kit DUO
11. Option: Cam kit

Part names

Linear-Rotary motors are supplied fully assembled. The following list gives information about the individual components used.

Variants model 52

PR01-52x40-R/37x120F-HP-C-80	(solid shaft)	Part-No: 0150-1573
PR01-52x40-R/37x120F-HP-C-80-L	(hollow shaft)	Part-No: 0150-2703

PR01-52x60-R/37x120F-HP-C-100	(solid shaft)	Part-No: 0150-1197
PR01-52x60-R/37x120F-HP-C-100-L	(hollow shaft)	Part-No: 0150-2704

PR01-52x60-R/37x120F-HP-C-150	(solid shaft)	Part-No: 0150-2705
PR01-52x60-R/37x120F-HP-C-150-L	(hollow shaft)	Part-No: 0150-2706

Variants model 52 with planetary gear

PR01-52x60-R/37x120F-HP-C-100-G05	gearbox 5:1	Part-No: 0150-2648
PR01-52x60-R/37x120F-HP-C-100-G10	gearbox 10:1	Part-No: 0150-2647

Variants model 84

PR01-84x80-C/48x240F-C-100	(solid shaft)	Part-No: 0150-1194
PR01-84x80-C/48x240F-C-100-L	(hollow shaft)	Part-No: 0150-1196
PR01-84x80-C/48x360F-C-100	(solid shaft)	Part-No: 0150-1199
PR01-84x80-C/48x360F-C-100-L	(hollow shaft)	Part-No: 0150-1200
PR01-84x80-C/48x240F-C-300	(solid shaft)	Part-No: 0150-1580
PR01-84x80-C/48x240F-C-300-L	(hollow shaft)	Part-No: 0150-2554

Variants model 84 in 'Stainless Steel'

PR01-84x80-SSC-C/48x240F-C-150	(solid shaft, Stainless Steel)	Part-No: 0150-1581
PR01-84x80-SSC-C/48x240F-C-150-L	(hollow shaft , Stainless Steel)	Part-No: 0150-1582
PR01-84x80-SSC-C/48x360F-C-150	(solid shaft, Stainless Steel)	Part-No: 0150-1579
PR01-84x80-SSC-C/48x360F-C-150-L	(hollow shaft Stainless Steel)	Part-No: 0150-1583

Variants model 84 with planetary gear

PR01-84x80-C-G/48x240F-C-150-G05	gearbox 5:1	Part-No: 0150-2531
PR01-84x80-C-G/48x240F-C-150-G07	gearbox 7:1	Part-No: 0150-2532
PR01-84x80-C-G/48x240F-C-150-G10	gearbox 10:1	Part-No: 0150-2533
PR01-84x80-C-G/48x360F-C-150-G05	gearbox 5:1	Part-No: 0150-2535
PR01-84x80-C-G/48x360F-C-150-G07	gearbox 7:1	Part-No: 0150-2536
PR01-84x80-C-G/48x360F-C-150-G10	gearbox 10:1	Part-No: 0150-2537

NOTE: Gear box motors may regenerate a lot of energy into the DC-Link → use drives with brake resistor or use additional DC-Link capacitor (10'000 uF)

Torque-Speed Curve Rotary Motors

Startup

The linear motor and rotary motor are electrically independent units. This means that the Linear-Rotary motor can be started up sequentially. It makes no difference which motor (linear or rotary) is started up first.

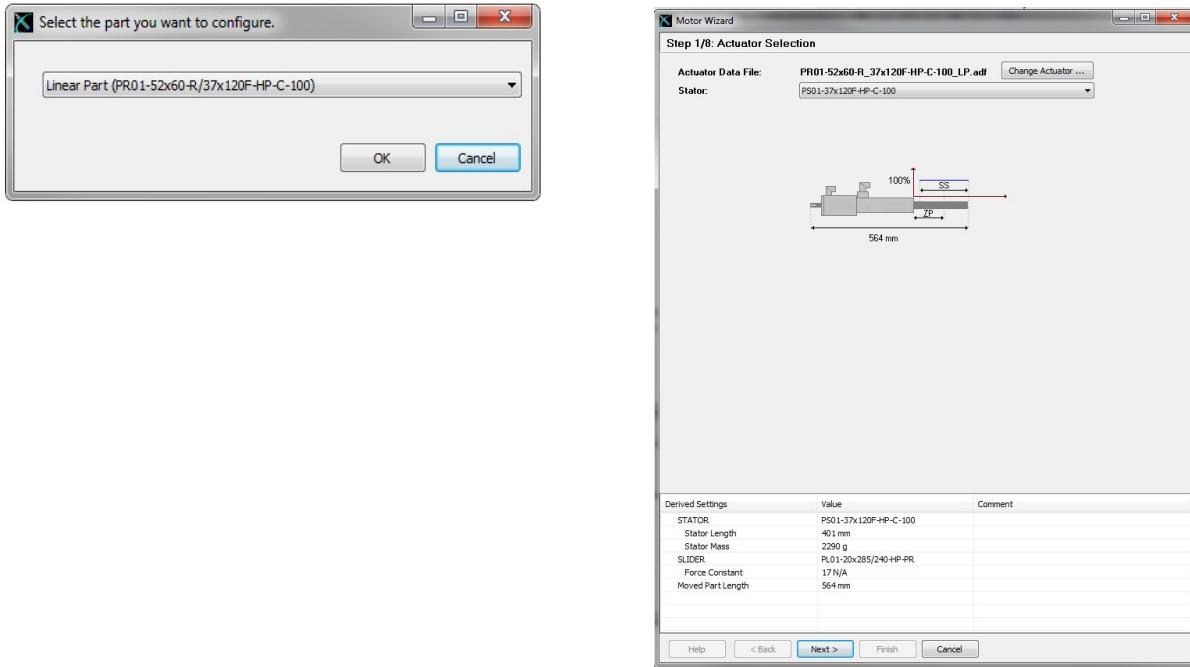

Drive settings

The various parameters for the linear motor and the rotary motor are set using the corresponding wizard in the LinMot Talk configuration program. (Contact LinMot Support if you do not see the folder "Motors\LinMot Linear Rotary Motor".)

The Linear-Rotary motors are located in the folder "Motors\LinMot Linear Rotary Motors". It makes no difference whether the linear or rotary motor is configured first.

Configuration Linear Motor

Configuration Rotary Motor

Homing the Rotary Motor

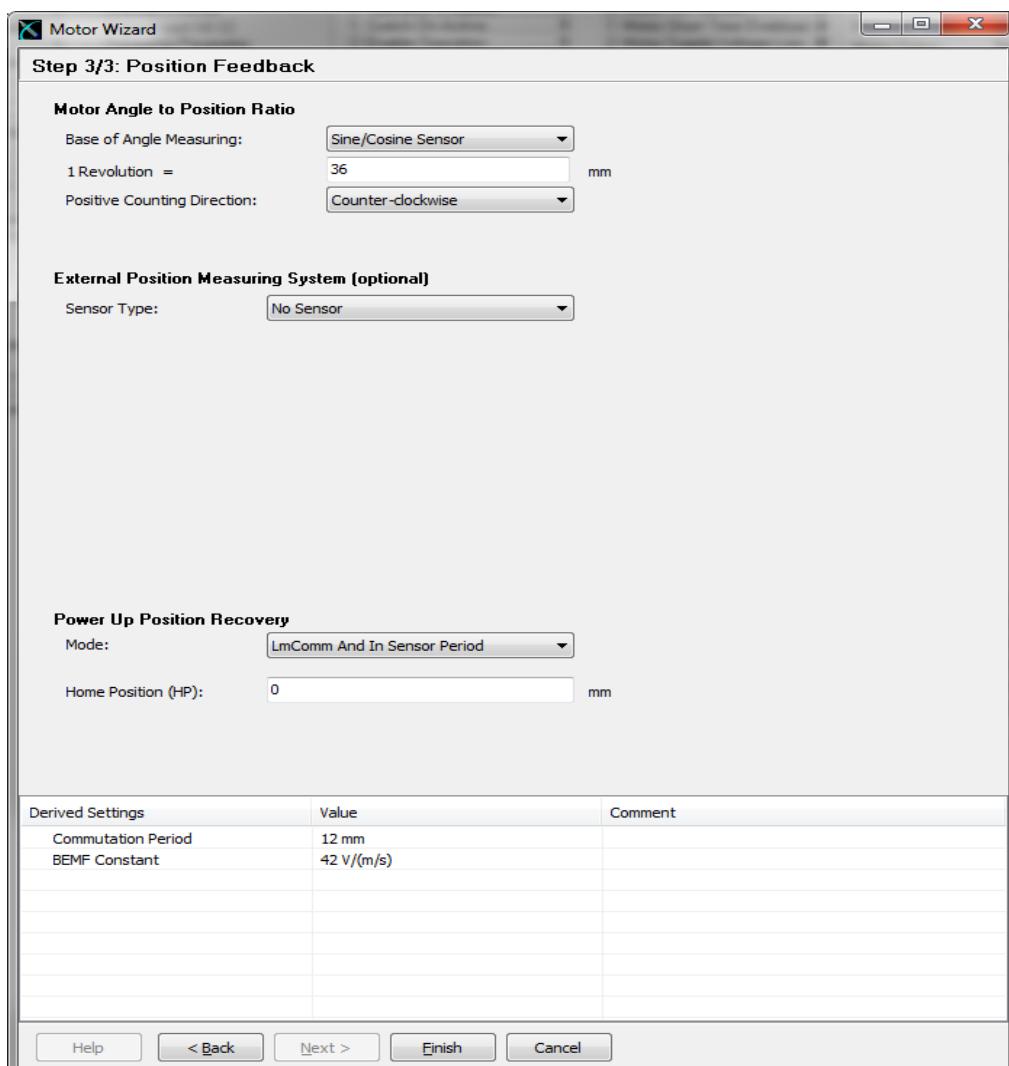

No homing is necessary, because the rotary motor uses an absolute measurement system (single turn).

Homing the Linear Motor

If the linear motor is homed to the internal stop of the Linear-Rotary motor, then the maximum homing velocity must be no greater than 0.01 m/s.

Example of VAI motion with Rotary Motor

The LinMot Talk program uses units on the parameter page the same way they are used to actuate linear motors. In order to control a rotary motor, therefore, a ratio between one motor revolution (360°) and the linear travel distance must be defined (**by default, 1 revolution through 360° corresponds to a linear travel distance of 36 mm**).

Motor Wizard: Motor Angle to Position Ratio

The ratio can be freely defined. Keep in mind that the "position" parameter type is defined as a 32-bit value and the maximum position resolution is 0.1 µm. This means that the maximum stroke is limited to between -214748 mm and 214748 mm.

Position [mm]	-214748 to 214748
1 revolution = 36 mm ($1^\circ == 0.1 \text{ mm}$)	Maximum number of revolutions = 11930
1 revolution = 360 mm ($1^\circ == 1 \text{ mm}$)	Maximum number of revolutions = 1193

The ratio, however, affects not only the positions but also the PID controller. The table below shows an example of this:

P [A/mm]	5
1 revolution = 36 mm ($1^\circ == 0.1 \text{ mm}$)	For a deviation of 1° , the drive reacts with 0.5 A
1 revolution = 360 mm ($1^\circ == 1 \text{ mm}$)	For a deviation of 1° , the drive reacts with 5 A

This means that if the "Motor Angle to Position Ratio" is changed, the controller parameters must be (manually) adjusted as well.

Example of motion using a VAI motion command

A VAI Motion Command (motion using the Velocity Acceleration Interpolator) can be started directly via the LinMot Talk program.

1) Definition of the movement:

Number of revolutions	25
Acceleration phase	100 [ms]
Maximal velocity	1500 [rpm]
Delay	50 [ms]
1 Revolution	36 [mm]

2) Converting the rotary parameters into the linear system:

$$\text{Target Position [mm]} = \text{Number of revolutions} * 36 \text{ [mm]} = 900 \text{ [mm]}$$

$$\text{Maximal Velocity [m/s]} = (1500 \text{ [1/min]} * 0.036 \text{ [m]}) / 60 = 0.9 \text{ [m/s]}$$

$$\text{Acceleration [m/s}^2\text{]} = \text{Maximal Velocity [m/s]} / 0.1 \text{ [s]} = 9 \text{ [m/s}^2\text{]}$$

$$\text{Deceleration [m/s}^2\text{]} = \text{Maximal Velocity [m/s]} / 0.05 \text{ [s]} = 18 \text{ [m/s}^2\text{]}$$

3) Entering the parameters in LinMot-Talk → Control Panel → Motion Cmd Interface

Enable Manual Override:

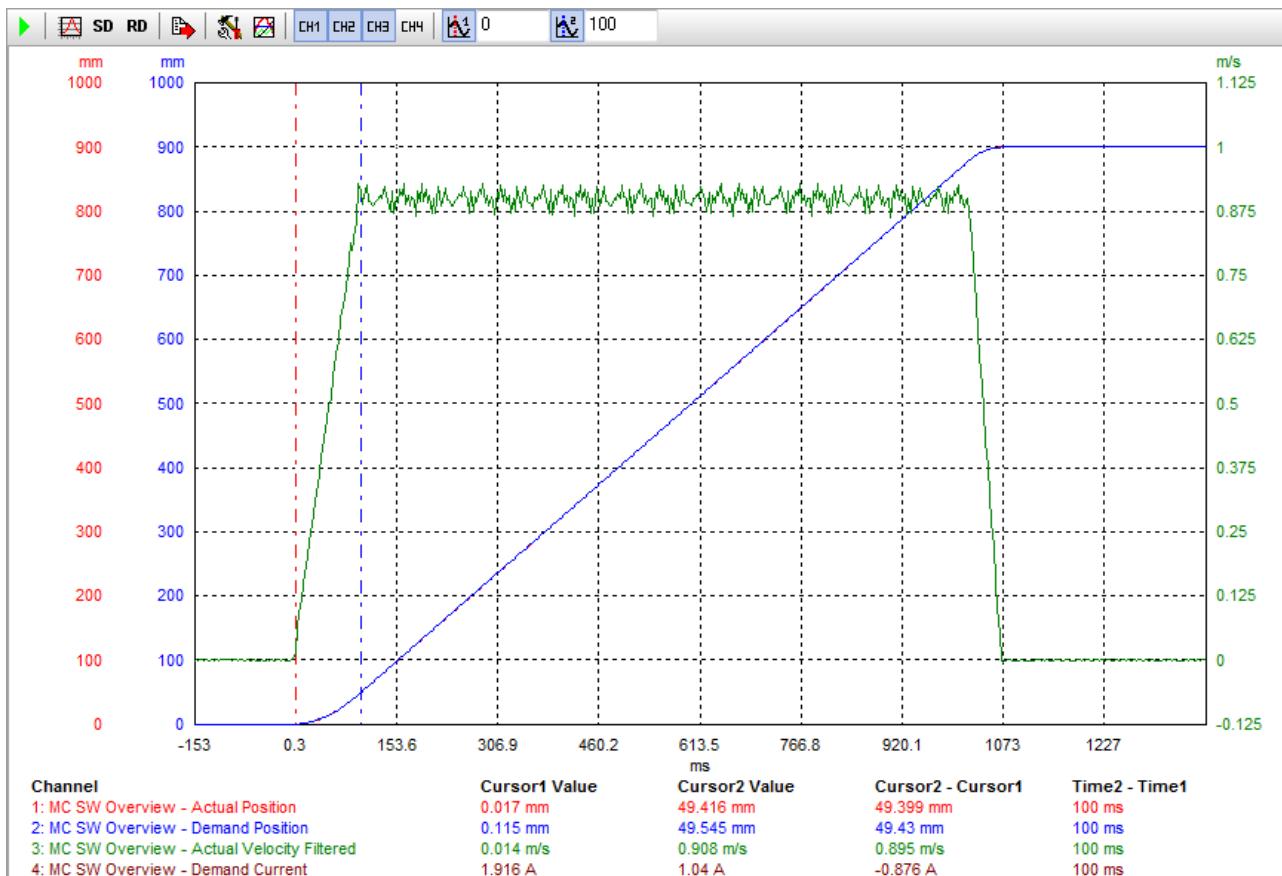

Command Category:

Command Type:

Count Nibble (Toggle Bits): Auto Increment Count Nibble

Name	Offs.	Description	Scaled Value	Int. Value (Dec)	Int. Value (Hex)
Header	0	010xh: VAI Go To Pos	257	257	0101h
1. Par	2	Target Position	900 mm	9000000	00895440h
2. Par	6	Maximal Velocity	0.9 m/s	900000	000DBBA0h
3. Par	10	Acceleration	9 m/s ²	900000	000DBBA0h
4. Par	14	Deceleration	18 m/s ²	1800000	001B7740h

Using the oscilloscope (integrated in LinMot-Talk), the motion can be recorded and the PID control parameters can be adjusted as needed.

Picture: LinMot-Talk - Oscilloscope

Notes on operating the Linear-Rotary Motor

Running in the mechanical end stop may damage the motor

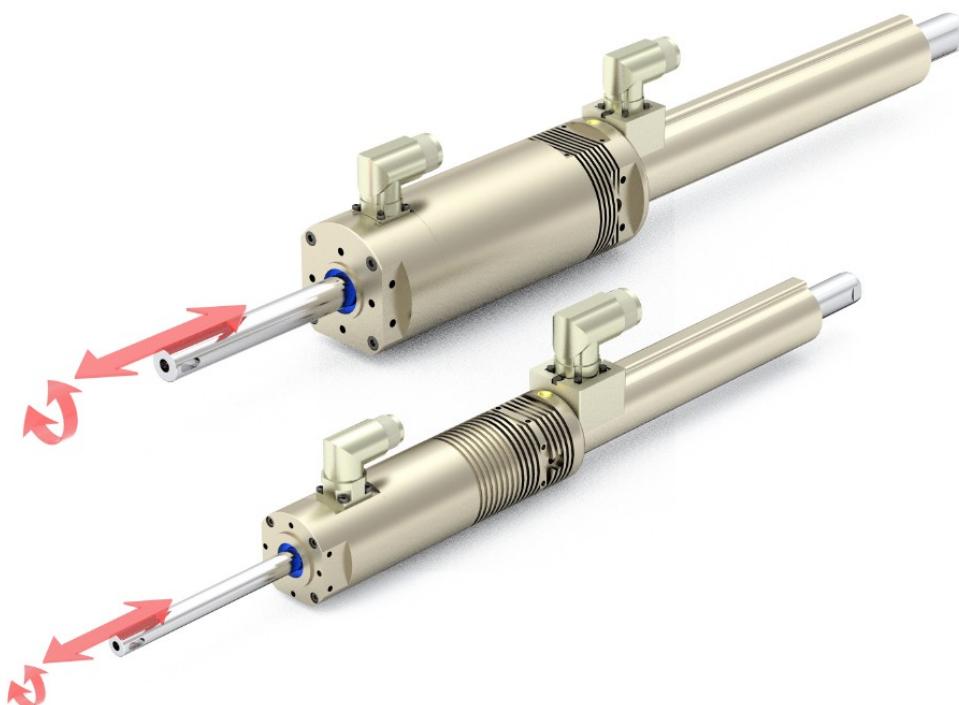

During operation the linear motor must not be allowed to strike the upper or lower internal stops, as this can cause damage to the Linear-Rotary motor. The internal stops can be used for homing purposes, but the homing speed must not exceed the value of 0.01 m/s. Specially by using a MagSpring for the weight balancing and no payload is attached, the MagSpring may shoot the unit into the internal stop and damage the unit! Use an external stop ring attached to the rod or cable tie holding an adapter to prevent this situation. -->Do not remove the stop ring/cable tie as long as no payload is mounted!

Pictures: External stop ring attached to the rod / cable tie holding an adapter

Strategy for the linear and rotating movement

The Linear-Rotary motor is designed to execute linear and rotary motions simultaneously. This means that the rotary and linear motions can be executed simultaneously and completely independent of one another. If the application permits, however, the following guidelines should be followed for physical technical reasons:
Rotary motions should be performed with the linear axis retracted if possible, as this can reduce vibrations and mechanical loads due to asymmetrical load mass. Execute rotary and linear motions sequentially, which makes the load on the electrical power source more uniform and thus leads to greater energy efficiency.

Linear-Rotary Motors with planetary gear

Linear-rotary motors with planetary gear will be used in all applications with high moment of inertia or high torque requirement.

Model 52 with planetary gear

Model 84 with planetary gear

Stainless steel variant of the PR01-84x80-SSC series

In addition to standard Linear-Rotary Motors, variants made of chromium steel are available in the PR01-84 series. Both the front flange and the rotary axis are made of chromium steel 1.4404 (V4A). The rotary axis is sealed against the stator.

For maintenance purposes, the front Part of the flange, where the seals and guides are located, can be removed. The Linear-Rotary motor does not need to be removed from the system in order to remove the flange.

Picture: Linear-Rotary Motor PR01-84x80-SSC-C/ 48x240F-C-150

Picture: Front part of the flange, includes sealing and bearings, can be replaced easily. Normally the complete front part with all seals and bearings will be replaced. In case that the seals and bearings are only cleaned the following lubricant has to be used: "fin food Grease 2" from INTERFLON

Notes on application of the PR01-84x80-SSC series

The design of the machine should consist of a 'normal' and a 'stainless steel' zone. The 'stainless steel zone' can be cleaned accordingly during operation. The two zones are separated by a stainless steel plate. The flange of the Linear-Rotary motor, also made of stainless steel, is inserted through this steel plate. The cylindrical front end of the flange has a groove with an O-ring that acts as a seal between the 'normal' and the stainless steel zones.

Picture: O-ring for sealing between 'normal' and 'stainless steel' zone .

Notes on cleaning the SSC variants

The rotary axis should not be set in motion while the line is being cleaned. It should be either fully extended or fully retracted. The chromium steel zone has IP65 class protection. The seals are made from FKM fluorelastomer and 85 AU 20991 polyester-urethane rubber.

Note

Linear-Rotary units with new or replaced seals will show an increased friction on both movements (linear and rotation) during the first hours of operation.

Special Application

Example: Linear-Rotary motors on a turntable

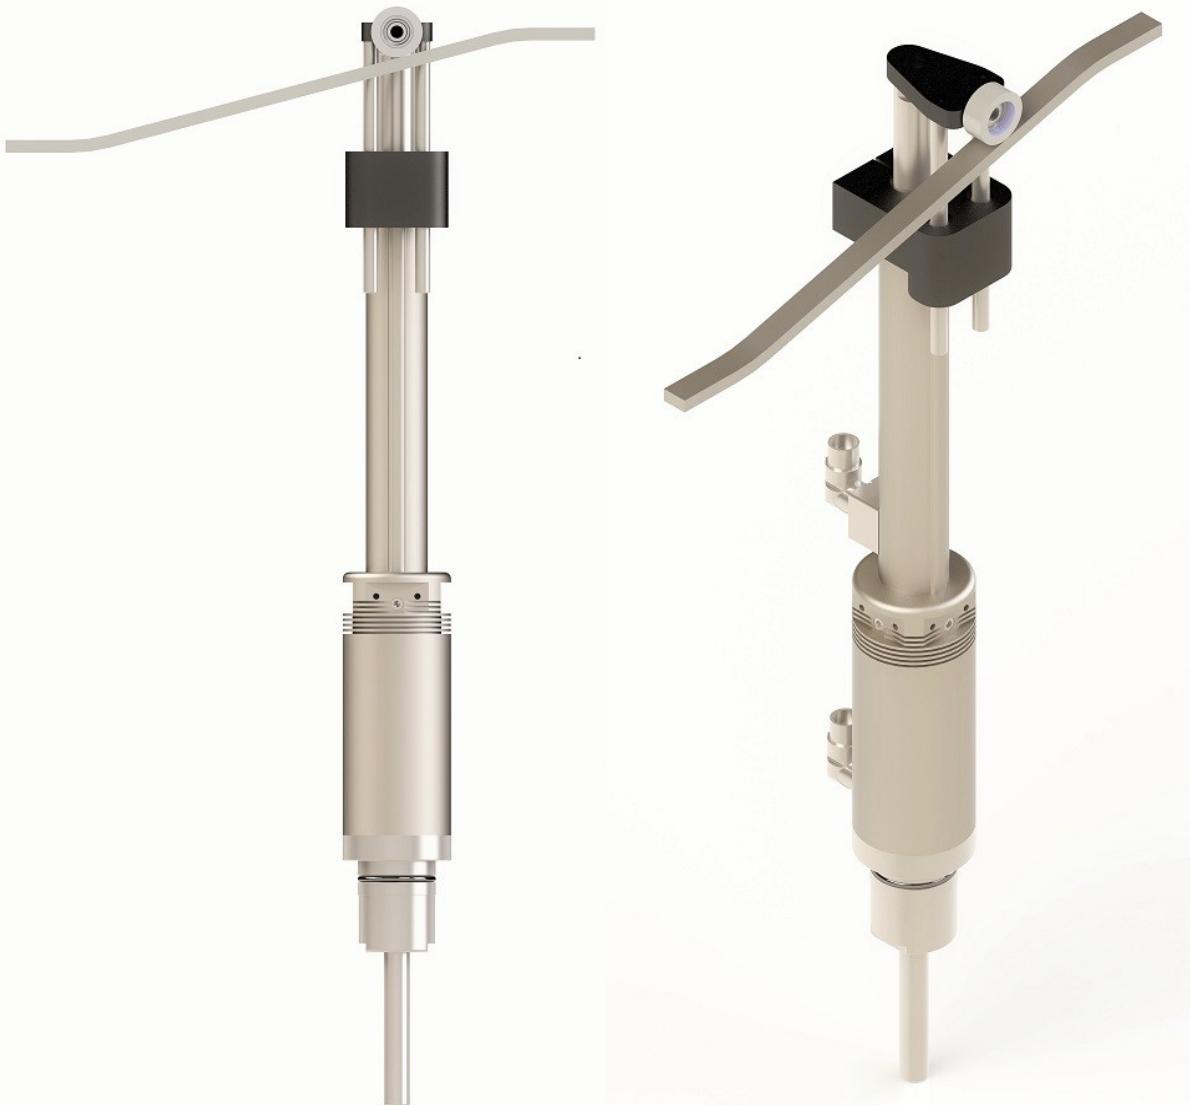

Picture: Typical arrangement of a system with Linear-Rotary motors and drives on a turntable. The lowest turntable is the divider between the 'stainless steel' and 'normal' zones. The drives for actuating the motors are located above the Linear-Rotary motors.

Cam profile for E-stop in applications with rotary disk

A fast turning rotary disk can not be stopped quickly during a loss of power emergency. This means the linear-rotary motor could be damaged if the rod is unpowered in the extended position and collides with other fixtures or tooling. An emergency guide profile at the point of possible collision helps to solve this situation by lifting the slider motor into the up position to prevent damage to other machinery.

The following picture shows a possible application of a Cam kit MF01-PK84 (Part-No 0250-2324). Cam kit forces the Linear Rotary Motor trough the pulley upwards.

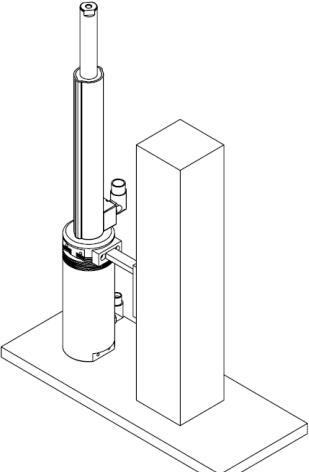

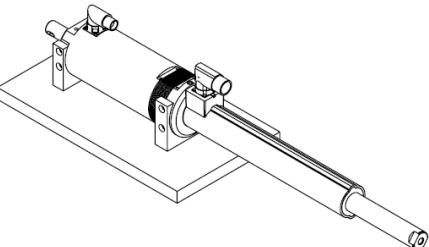

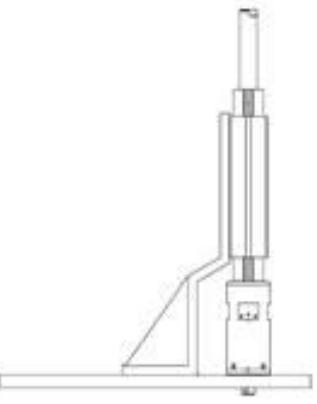

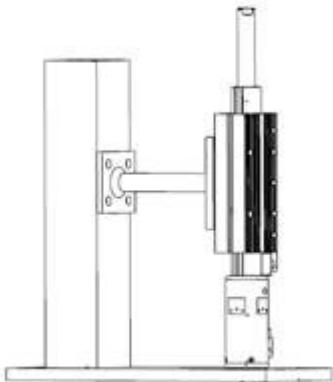

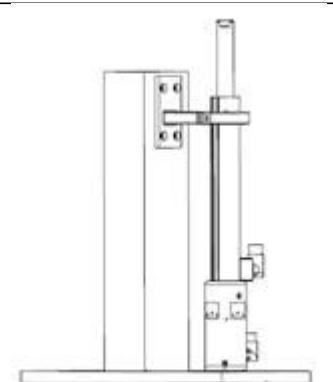

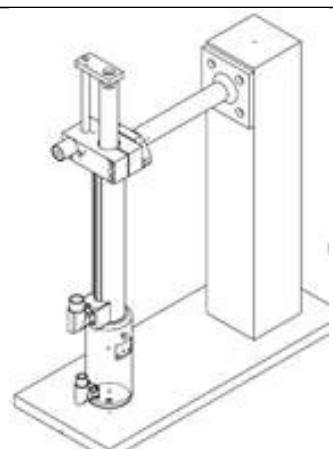

Picture: At the critical position the crank forces the moving part of the linear-rotary motor up in case of a power breakdown. (Caution: Mechanical end stop is not shown!)

Caution: Make sure that the Cam kit or any other auxiliary equipment that pulls or pushes the Linear-Rotary Motor upwards has its own mechanical stop. Linear-Rotary Motor internal collisions may not be used as an end stop in any case. Using Linear-Rotary Motor internal collisions may damage the unit. In addition the motor must be supported (see chapter Installing Linear-Rotary Motors) to absorb any side load of the crank.

Installing Linear-Rotary Motors

The PR01 Linear-Rotary motors have a center fit on the front side so that the rotary axis can be precisely aligned. Due to the narrow construction of the Linear-Rotary motors, it is most often not sufficient to mount them by the front bolts alone (due to vibration or lateral loads). An additional support is then necessary. From a technical point of view the support should be done at the end of the motor to reduce any oscillations. Note that tolerances must be compensated (e.g. through long holes) to eliminate any tension to the motor between the two mounting points. The following sketches show examples of the various possibilities. The chapter on installation drawings contains detailed dimensions.

 A technical sketch showing a linear-rotary motor mounted on a base plate. A vertical rectangular block is positioned to the right of the motor's shaft, providing side support. The motor's front flange is secured to the base plate.	Front mounting with side support
 A technical sketch showing a linear-rotary motor mounted on a base plate. The motor is oriented horizontally, and its bottom flange is secured to the base plate through side mounting holes. A cable is attached to the side of the motor.	<p>Bottom mounting, mounted through linear-rotary side mounting holes Compensate tolerance using a washers (if necessary), when the linear-rotary is fixed through bottom mounting holes</p>
 A technical sketch showing a linear-rotary motor mounted on a base plate. The motor is angled, and its front flange is secured to the base plate. A vertical heat sink is attached to the side of the motor, and a support arm extends from the base plate to provide additional stability.	Angle and heat sinks support

Wipers

The rotary axis is protected against dirt and loss of grease by a wiper on the front side. The back side of the linear motor slider should also be protected by means of a wiper. The options 'wiper' and 'multifunctional flange' are available for this.

	Description	Part- No.	D	L	A	Mass
Wipers for model 52 PS01-37x120F-HP-C..	PA01-37/20-F	0150-3126	45mm (1.77in)	32mm (1.26in)	12mm (0.47in)	0.028kg
Wipers for model 84 PS01-48x240F-C-... PS01-48x360F-C-...	PA01-48/28-F	0150-3127	58mm (2.28in)	32mm (1.26in)	14mm (0.55in)	0.056kg

Multifunction flange and MagSpring

The multifunctional flange can perform one or more of the following functions:

- Wiper for the linear motor slider
- Mounting a MagSpring spring for load compensation
- Mounting a pneumatic brake
- Mounting element for the Linear-Rotary motor

Effective force of the MagSpring

Depending on the orientation of the MagSpring slider, the effect of the force can be modified. This means that the MagSpring pulls the rotary axis of the Linear-Rotary motor inward, or pushes it outward.

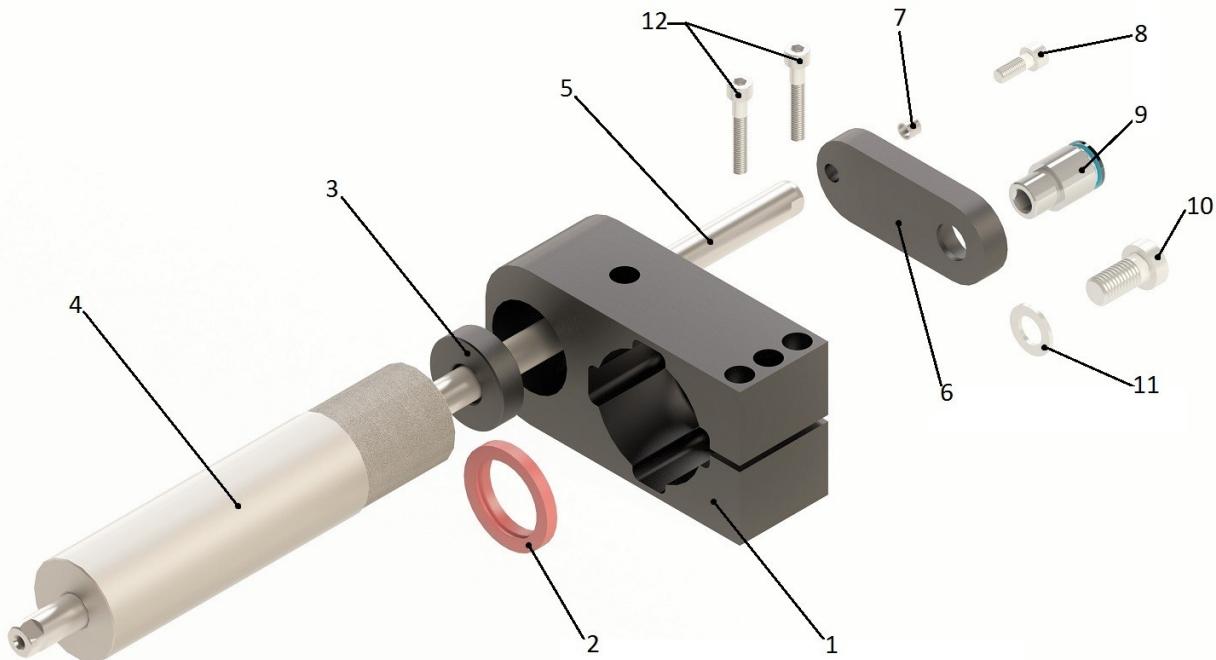

Top: 'Pushing' MagSpring
Bottom: 'Pulling' MagSpring

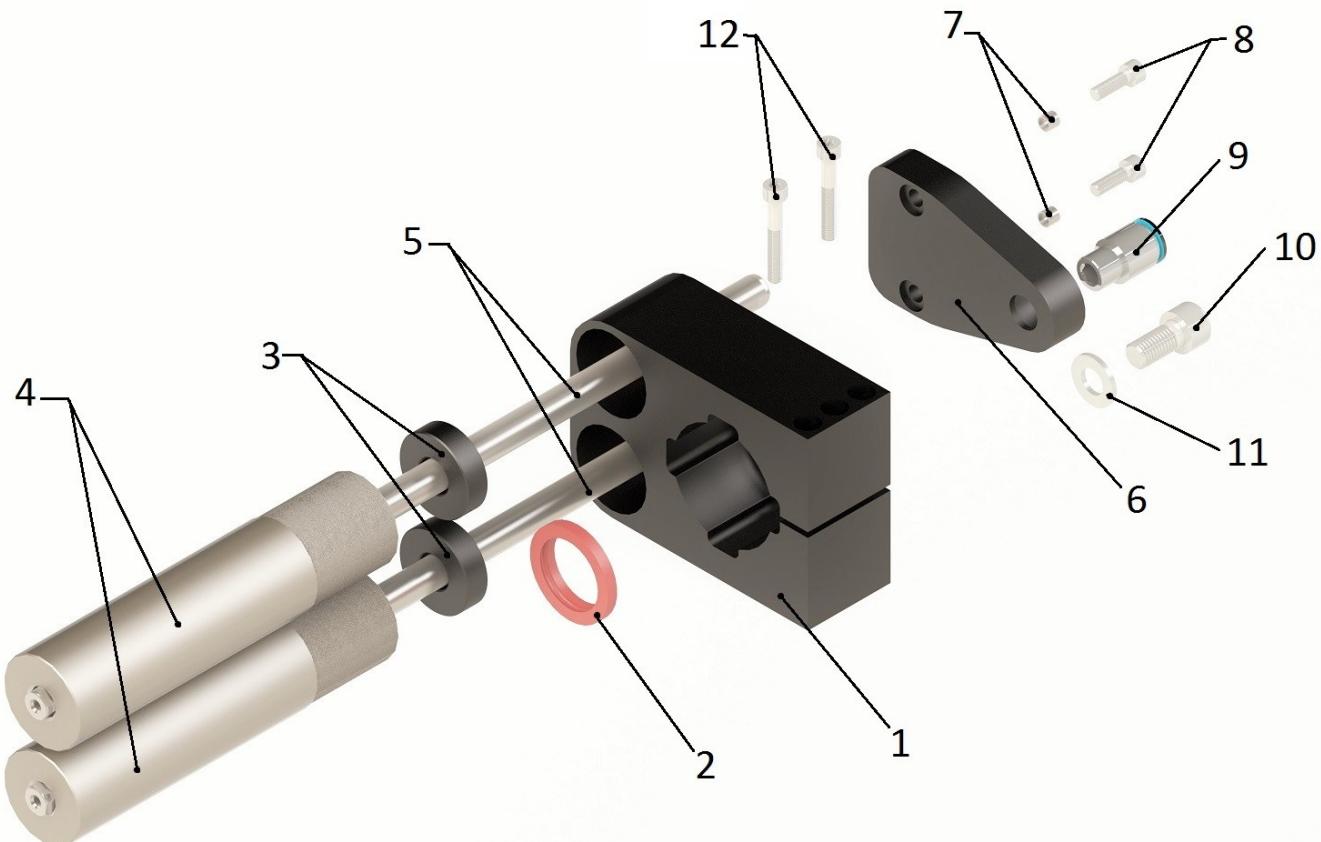

Specially by using a MagSpring for the weight balancing and no payload is attached, the MagSpring may shoot the unit into the internal stop and damage the unit! Use an external stop ring attached to the rod to prevent this situation

Picture: External stop ring attached to the rod

Example:

Linear-Rotary Motor model 52 with MagSpring of force 40N: Stator: MS01-37x155
Slider: ML01-12x350/160-10

Linear-Rotary Motor model 52 with MagSpring of force 60N: Stator: MS01-37x155
Slider: ML01-12x350/160-20

Load attachment

Because both a rotary and a linear motion are performed, the type of attachment must be selected such that it can support both torques and longitudinal forces.

Clamp sets that enable fast, easy mounting of the load Mass are available as accessories. They provide a force-fit connection that is created by two conical rings. This completely eliminates the need for inserting lugs or producing grooves.

Technical data

RS01-SS12x22 :	Tmax: 20Nm Fmax: 3kN	Tolerance for fit D: 22H9 mm

Extension cables are double shielded. The two shields of the extension cables must not be connected together: The inner shield of the extension cables is used as GROand and must be connected to GROand*, only the outer shield must be connected to SHIELD* of the connectors.

Caution: **Do not connect or disconnect motor when there is power on the controller.**
Double-check each connection!
Wrong connections can destroy controller and stator!

Maintenance of LinMot® Linear-Rotary Motors

LinMot Stators will be shipped with an initial lubrication. Maintenance will only be required if the motors run 'dry' or there is a heavy pollution of the motors.

Under normal industrial conditions (5 day, 8h/day) one inspection every 3 months is adequate. Where conditions differ, as with severe and permanent fouling, direct sunshine, operation out in the open, increased operating temperature etc., the maintenance intervals must be shortened till empirical values for the particular application are obtained.

Inspection

Inspections have to be executed according to the operating condition and the load of motors. Following points have to be checked during inspection:

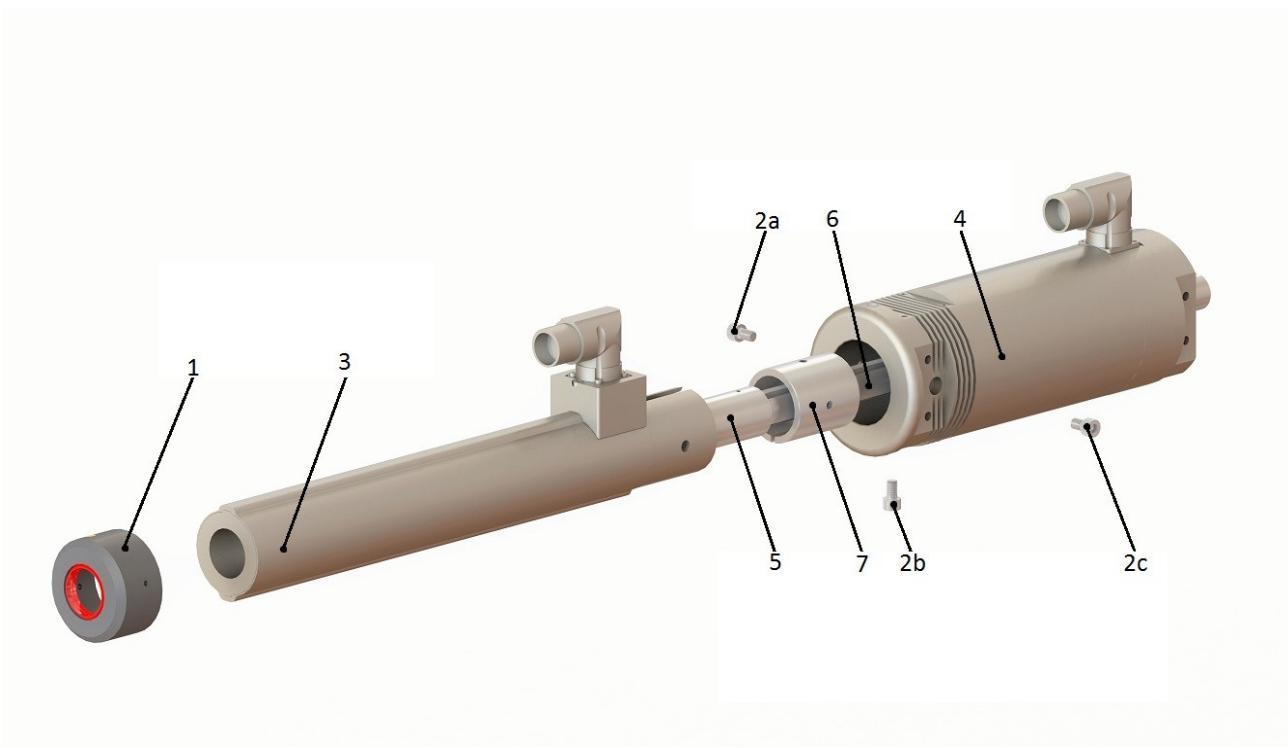

- Is a film of lubricant on the slider?
- Is the wiper (if existent) without visible wear?
- Is the lubricant not adhesive?
- Can the slider be moved easily?

If the motors are heavily polluted respectively if no film of lubricant is on the slider, then stators and sliders must be cleaned and lubricated again.

Cleaning and lubrication

Disassembling and cleaning

If existing, remove wiper (1) from the stator. Open fastening screws (2a, 2b and if existing 2c) between rotary motor and linear motor. Pull the stator (2) rapidly back over the slider (5) to prevent sticking to the Stator (3). Don't attempt to loosen the slider (5) from the rod (6). Attention: huge magnetic attraction of the slider! Clean slider (5), stator (3) and grooves (6) with cleaning agent LU06.

Lubrication and assembling

Lubricate the grooves (6) with 2-3 g (0.1 oz.) LU02. Lubricate the bore of the stators (3) with about 2-3 g (=0.1 oz.) lubricant LU02. There should only be a slight film of lubricant. Do not over lubricate! Lubricate the slider (5) with a soft fabric or manually. 4 g of lubricant per meter slider is enough to create a film of lubricant on the surface of the sliders. (4 g (0.14 oz.) is about $\frac{1}{2}$ of a hazelnut). Do not over lubricate! Especially in higher operating temperatures, over lubrication can lead to a gumming of the lubricant. (In such a situation the motor must be cleaned completely.) If wipers are used then the inner side of the seals of the wipers must be lubricated as well. Do not lubricate outside of the wipers!

Assembling: move the mounting ring (7) adjusted into the stator (3). Make sure that the slider (5) is centered with a cardboard or wood wrapping because of the magnetic attraction to the outside of the stator (3). Then move the stator (3) over the slider (5). Tighten the fastening screws 2a and 2b simultaneously to make sure the slider, stator, and rotary motor are concentric. If existing then tighten screw 2c lightly in the same manner. Use bolt lock (medium).

Lubricant

The lubricant reduces the friction between the chromium-nickel steel surface of the slider and the reinforced plastic plain bearing.

LinMot® Lubricant LU02 Art. No. 0150-1953 (8g)

LinMot® Lubricant LU02 Art. No. 0150-1954 (50g)

LinMot® Lubricant LU02 Art. No. 0150-1955 (1000g)

LinMot® LU02 Lubricant corresponds to KLÜBERSYNTH UH1 14-31 which was developed for the food processing industry.

Cleaning Agent

The following Cleaning Agent spray is recommended for LinMot Stators and Sliders:

LinMot® Spray LU06-250 (250ml) Art. No. 0150-2394

LinMot® LU06 Lubricant corresponds to KLÜBERSYNTH NH1 4—2 which was developed for the food processing industry.

Storage / transport

- Sliders are to be stored and transported only in the plastic containers (with cardboard inlay) provided for this, or already fitted in *LinMot®* motors and secured.
- Maximum storage temperature: 70 °C

Trouble Shooting

Trouble Shooting of Linear Motors

The following tables show the resistive value between the different connector pins for each stator type. If the value is not in a range of +/- 10% the stator may be damaged (temperature of the stator for all measurements: 20°C).

Caution: Handling Instructions for Sliders

LinMot Slider

LinMot® Linear Motor sliders must be handled with care especially if not assembled within the stator! Damaging or warping of the slider can result in shortened life and/or failure of the motor. The slider is essentially a high-precision machine component consisting of neodymium magnets and plastic materials assembled in a thin steel tube. Do not use sliders who are already damaged on the surface (scratches, deformation, etc.). This can provide a further damage of the stator! Keep slider away from unshielded flame or heat. Temperature of more than 120°C will cause demagnetization.

Magnetism

LinMot® sliders contain neodymium magnets which may disturb or damage magnetic data carriers and delicate electronic equipment merely by coming close to them. Examples for such equipment are: television and computer monitors, credit cards and EC-cards, computers, floppy discs and other data storage medium, video tapes, mechanical watches, hearing devices and loudspeaker. Heart pacemakers can be disturbed by strong magnets. Keep a minimum distance of 1m.

Crushes

When handling sliders be aware that, due the strong magnetic attraction, serious injury from fingers being pinched between the slider and nearby steel parts is a very real possibility if caution is not exercised.

No modification of sliders provided by customers is allowed!

Do not modify the slider in any way. Any modification could destroy the included magnets and magnet dust can be build. Magnet dust is easily inflammable! NdFeB-Magnets are not made of steel. These magnets are sintered and due to that highly breakable.
